

Useful cisco aliases

Written by Alexei Spirin

Although there are a lot of cisco command aliases that everyone could do I prefer to use original commands (the typing speed matters though). The exceptions are several pretty complex and often used commands (such as ipsec-related ones) and commands that look like scripts. The examples are below:

IOS config: Useful cisco aliases

```
alias exec sciss show crypto isakmp sa
alias exec scips show crypto ipsec sa
alias exec ccs clear crypto sa
alias exec cci clear crypto isakmp
alias exec ps show proc cpu | excl 0.00%__0.00%__0.00%
alias exec br show run | include interface | ip address | description
alias exec diff sh arch conf diff nvram:startup-config system:running-config
```

The ipsec aliases are very useful for configuring/debugging IPsec, especially during CCIE Security lab preparation.
